

## **" In vivo Diagnostic Imaging: from Contrast Media to Molecular Probes"**

Abstract: In vivo diagnostic imaging is a powerful tool in the strategy of a modern healthcare system. Today a large variety of well known contrast media are part of the armamentarium of radiologist and physicians. Nevertheless big changes are foreseeable in the near future and new probes working at molecular level are under investigation in the major academic and industrial research groups. This lecture will provide an overview of the field with emphasis on the new frontier of molecular imaging.
